tinypy is a minimalist implementation of python in 64k of code

<http://www.imitationpickles.org/gallery/1078006767>

Cuzco the Goat is the tinypy mascot

tinypy includes a whole heap of features:

- parser and bytecode compiler written in tinypy
- fully bootstrapped
- luaesque virtual machine with garbage collection written in C

it's „stackless“ sans any „stackless“ features

- cross-platform :) it runs under windows / linux / macosx
- a fairly decent subset of python

- classes and single inheritance
- functions with variable or keyword arguments
- strings, lists, dicts, numbers
- modules, list comprehensions
- exceptions with full traceback
- some builtins

- batteries not included - yet

What more could you possibly want?

a pony?
